HOW DO I KNOW IF I AM IMMUNOCOMPROMISED?

Simply put, it is when your immune system isn't working as well as it should to protect you from infection.

This could be because of a GENETIC MUTATION OR DISEASE, such as HIV, rheumatoid arthritis, or lupus, that causes a loss of immune function, or because of CERTAIN MEDICATIONS, including immunotherapy.

If you believe you may be immunocompromised but are unsure, speak with a healthcare professional about your concerns.
